ON-SITE SOFTWARE ENHANCES INSPECTION PROCESS

MAY 2012

BRAND SERVICES has gone paperless.

In February of 2012 BRAND worked in conjunction with a software company to develop an inspection, repair and maintenance documentation software program to streamline our documentation process and provide our clients with the best reports possible. Our efforts resulted in the BRAND ID Tracker system. The system combines our technicians, software, handheld devices and the Internet to automate BRAND's focus of NFPA 101 Life Safety Code Inspections, Repairs and Maintenance.

Our new system eliminates the need for data entry. This tracking program allows BRAND to process our findings, in real time, electronically to our server, which means as an asset or item is being inspected and photographed, i.e. Fire/Smoke Dampers, Fire Door and Fire Barriers, the inspection/repair findings are transmitted back to our server at BRAND's headquarters in Connecticut.

Our top of the line reports can be customized to each customer's request, whether you prefer your assets listed by deficiency, identification number, location or any other field, BRAND can tailor the reports to fit your needs.

BRAND has had a online reporting feature for many years, but with our new documentation system the reports sit on our server. Each customer will be issued a invite via email which will give you access to your reports anytime. No longer will you have to worry if the Joint Commission walks through your door and you can't locate your binder of Damper Inspections, just log into BRAND's server and your reports are waiting for you. You can sort your reports, print or save them or even share you log in the an AHJ so that they can review the reports from their own computers.
